

A Sample L^AT_EX Abstract for LLMC on Probability & Statistics

Betsy Lee & John Hsu

Department of Mathematics

Southern Illinois University Carbondale

Kris Woo

Department of Mathematics, Statistics, & Computer Science

University of Illinois Chicago

This is a sample L^AT_EX abstract for your talk at the LLMC (Langenhop Lecture & Mathematics Conference) on Probability & Statistics. You should submit your abstract using this file as a template. If there are figures in the abstract, the preferred figure format is PDF. Please also indicate the area of specialization of your talk at the end of the abstract.

Please email your abstract *in plain text* to dfritcher@siu.edu, together with any figure files for the abstract. You may submit an extended abstract following the format of this template file.

In this talk, we present a new characterization for the simultaneous Lyapunov diagonal stability of a matrix set \mathcal{A} via Hadamard multiplications by any positive semidefinite matrices. Our development relies mainly on a new notion called \mathcal{P} -sets.

Area of Specialization: Mathematical Statistics
